generating polymucleotides encoding chimeric or fusion profeshs and heterologous protein sequences. The polymucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic use; as markers for tissues in which the corresponding protein is professored; as markers or tags to identify chromosomes or to map related gene chromosome markers or tags to identify chromosomes or to map related gene positions; to compare with endogenous DNA sequences in patients to identify potential genetic disorders; as probes to hybridise and discover genes, related DNA sequences as a source of information to derive PCR primers for genetic fingerprinting; as a probe to subtract-out known sequences in the process of discovering other novel polymucleotides; for sequences in the process of discovering other novel polymucleotides; for actachment to a gene chip or other support, including for examination of expression patterns; to raise antiportein antibodies using DNA immunisation techniques; and as an antigen protein antibodies using DNA immunisation techniques; and as an antigen to raise anti-DNA antibodies or elicit another immune response. The polymucleotides and polypeptides can also be used as nutritional sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as an itrogen source or as a source of carbohydrates. The polymucleotides and polypeptides can also be used treat closure of non-fortusing woulds, for the generation and regeneration of tissues, for gut protection or regeneration and regeneration of itssues, for graft versus host disease. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease). sepsis, rheumatoid arthritis, diabetes mellitus type 1 or graft versus host disease. The present sequence from the present inflammatory conditions (e.g. arthritis, and sequence from the present invention. N. B. The sequences for this patent were obtained from the prevence of the provest of the provest of the provest

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      #25
                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated polynucleotide (I): comprising a nucleotide sequence selected from SEQ ID NO:1-244; which encodes a polypeptide with biological activity, where the polynucleotide hybridises to (I) under stringent hybridisation or has greater than 99% sequence identity with (I). (I) has respected antibacterial, immunosuppressive, antidiabetic and antirheumatic activities, and can be used in gene therapy. (I) can be used for generating polynucleotides encoding chimeric or fusion proteins

                                                                                                                                                                                                                                                                                                               The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating insulin-like growth factor-1 (IGF-1) receptor are useful for treating insulin-like growth factor (IGF)-sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful screening for compounds that bind to IR or IGF-1 receptor, potential therapeutics and research reagents. AAU88034-AAU90957 represent IR and/or

                                                                                                                                                                                                                     encoded based AAZ41325-
                                                                                                      This invention describes novel cDNA sequences (A) highly expressed in normal uterine tissue which can have anticancer and cytostatic activity and can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine cancer (ii) directly for treating this form of cancer (including expression fine gene therapy vectors) and (iii) for generation of specific antibodies.

(A) are identified by assembling ESTs (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAY59838-Y59892 represent protein fragments encoded the human uterine tissue derived cDNA fragments represented in AAZ41328
                                                                                                                                   (B)

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or agane an which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a scrivity; (11) a culture comprising strains in which the strains is present in a culture or collection of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for extent or collular proliferation to isolate candidate molecules for rational and an organism or for extensional and an organism of an organism or extension and extensional and an organism or extension of an organism or extensional and an organism or extensional and an organism or extensional and an organism or extension of an organism or extension or an organism or extension or extensional and an organism or extension or extensional and an organis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transduction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
  useful for identifying proteins or s required for cellular proliferation for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lipoprotein receptor binding protein; signal tran binding protein; LDL receptor signalling pathway

The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) receptor binding protein (I) with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) with an LDL receptor interaction of (I), where in the absence of the stress, the system provides an unbiased interaction of (I), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from caress alters the interaction of (I) and (II). (I) is selected from SEMCAP-1, JIP-1, PSD-95, JIP-2, Talin, OMP25, CAPON, PIP4,5 Kinase, Na channel brain 3, Mintl, ICAP-1 and APC subunit 10. The method is useful for detecting a stress that alters functional interaction of LDL receptor binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating signal transduction through LDL receptors. ABB04778 to ABB04909 represent LDL receptor binding proteins which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;

                                                                                                                                            The specification describes antigen binding molecules with increased Foreceptor binding affinity and effector function. These antigen binding molecules may have modified glycosylation, and are especially specific for human B-cell marker CD20. The invention is useful for diagnosing, preventing or treating disorders or diseases treatable by B-cell depletion, such as B cell lymphoma. The present sequence represents the variable heavy chain region of the murine antibody B-Ly1, and antibody which binds CD20. The sequence is used to produce antigen binding molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             <u>й</u>

        * polynucleotides and encoded antigen binding molecules with inc
receptor binding affinity and effector function, useful for
agnosing, preventing or treating B-cell proliferative disorders,
aluding B cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides and encoded antigen binding molecules with inc Fc receptor binding affinity and effector function, useful for diagnosing, preventing or treating B-cell proliferative disorders, including B cell lymphoma.
                                                                                    The specification describes antigen binding molecules with incr receptor binding affinity and effector function. These antigen molecules may have modified glycosylation, and are especially s for human B-cell marker CD20. The invention is useful for diagn preventing or treating disorders or diseases treatable by B-cel depletion, such as B cell lymphoma. The present sequence represanting molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  antigen binding molecule; Fc receptor; B-cell marker; CD20; antibody engineering; B-cell depletion; B cell lymphoma; cytost hematological disease; immune disorder; neoplasm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Moes
                                                                                                                                                                                                                          ;

The specification describes antigen binding molecules with increased Foreceptor binding affinity and effector function. These antigen binding molecules may have modified glycosylation, and are especially specific for human B-cell marker CD20. The invention is useful for diagnosing, preventing or treating disorders or diseases treatable by B-cell depletion, such as B cell lymphoma. The present sequence represents an antigen binding molecule of the invention.
                                                                                                                                                                                                                Gaps

the of Novel peptides capable of binding Rhesus D antibodies are used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. hemolytic disease newborn (HDN).

Page 12; 19pp; English. 1; Claim

The present sequence represents a peptide capable of binding Rhesus D antibodies (I). Also described in the present invention are: (1) a nucleic acid (II) encoding (I); (2) a vector (III) comprising one or more (II) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) peptides having immunologic properties of Rhesus D protein epitopes comprising subjecting an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage display library, and identifying immunogenic peptide sequences which are

of the
mimotopes which differ in their amino acid sequence from the amino acid sequences of Rhesus D protein; and (6) peptides (V) with immunological properties of Rhesus D protein epitopes obtained by (M1). (I) is used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. haemolytic disease of the newborn (HDN) or idiopathic thrombocytopaenic purpura (ITP), for the manufacture of an affinity reagent for anti-Rhesus D antibodies purified or removed from body fluids or immunoglobulin preparations. Using (I) as an immunogen to raise anti-Rhesus D antibodies avoids using immunisation with foreign erythrocytes thereby avoiding the risk of transmission of viral diseases like AIDS and hepatitis B

binding Rhesus D antibodies are used the diagnosis, therapy or prophylaxis Rhesus D antigen, e.g. hemolytic diseas

AAU03601-AAU03722 represent Group, B Streptococcus (Streptococcus agalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and meningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children arising from the maternal genital tract. An immunogenic composition is useful in the preparation of a medicament for the treatment or prophylaxis of Group B Streptococcus infection. The invention does not have the disadvantages of varied response rate associated with prior art

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concaining a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host.cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding che polypeptide; (6) inhibiting cellular the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway. It which a proliferation or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which the test compound that inhibits proliferation of an or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      screening

strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a recombinant DNA construct comprising a promoter is positioned t promoter functional in a plant cell, where the promoter is positioned t provide for expression of a polynucleotide encoding a polypeptide from microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant is a crop plant ransformed plant is a crop plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A construct comprising a promoter positioned to provia polynucleotide encoding a polypeptide from a useful for producing plants with improved properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         carbohydrate;

cuch as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.

cuncing a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cantisense nucleic acid; (4) an antibody capable of specifically binding collideration or the activity of agene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity aginst a biological pathway required for proliferation, or that inhibites cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or owhich each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the trarget prokaryotic essential genes a Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide; (2) producing the polypeptide; (3) an isolated by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation, or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation; (8) identifying a gene required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiolic; (10) profilling a compound; a activity; (11) a culture comprising strains in which the strains or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the carains or (13) identifying the target of a compound that inhibits the carains or (13) identifying for homologous nucleic acids are useful for for cellular proliferation to isolate candidate molecules for rational contents or cellular proliferation or for enreaning for homologous nucleic acids required for a compound collection of an organism. The antisense molecules for rational collection of an organism or for enreaning for homologous nucleic acids required for a content or cellular proliferation or for enreaning for homologous nucleic acids required for the processing the foreign and the processing or for enreaning for for enreaning for production or cellular proliferation or for enreaning for enreaning for acids are useful for the product is over the process or collection or cellu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ed by one of
